

## Voxengo SPAN Version 3.7 Update

Voxengo SPAN version 3.7 update is now available for download. SPAN is a free real-time “fast Fourier transform” audio spectrum analyzer plugin for professional music and audio production applications. SPAN is available in AudioUnit, AAX, VST and VST3 plugin formats, for macOS, and Windows computers.

Version 3.7 adds the "True Peak/Sample Peak" switch which can be used to switch between true peak and sample peak indication.

SPAN provides you with a very flexible “mode” system which you can use to setup your spectrum analyzer preferences. You may specify Fourier block size in samples, FFT window overlap percentage, spectrum's visual slope. Beside that you can choose to display secondary spectrum of a desired type (e.g. real-time maximum, all-time maximum). Spectrum can be smoothed out visually for an easier examination.

Voxengo SPAN and other pro audio plug-ins can be downloaded at the Voxengo Web site.
