Bosch updates Loudspeaker & Voice Alarm Systems Portfolio

The Bosch brand introduces the next generation loudspeaker portfolio for public address and voice alarm systems, setting a new direction in performance, efficiency, and reliability. The first products in this renewed line-up are the Bosch horn loudspeakers, specifically designed to deliver clear and dependable sound in the most demanding environments. The launch marks the start of a phased modernization of the Bosch PA/VA loudspeaker range. The new structure organizes the full portfolio into three tiers; Entry, Mid, and Performance level, making it easier for consultants and system integrators to find, select, and specify the right loudspeaker for each project.

Developed for environments where safety and reliability are essential, the new series of horn loudspeakers combine IP66-rated weather protection, robust materials, and full EN 54-24 certification to ensure dependable operation in harsh conditions. Installation has also been simplified: the redesigned mounting bracket enables faster, tool-friendly setup, while End-of-Line (EOL) and End-of-Branch (EOB) modules can be fitted directly inside the back can. This allows seamless integration with the PRAESENSA PA/VA system, including continuous monitoring and fault detection.

Suitable for warehouses, offshore platforms, industrial facilities, maritime applications, and transport hubs, the new horn loudspeakers combine acoustic performance with durability and ease of installation, delivering reliable communication in critical situations.
