Erica Synths Zen Delay Virtual

Following the phenomenal success of its hardware FX unit Zen Delay, Erica Synths announces Zen Delay Virtual (ZDV), its virtual successor. Much more than simply a digital replica or replacement of the hardware unit, ZDV brings extended functionality into play, making it an ideal 'secret weapon' for almost any instrument or studio application.

Building on the hardware capabilities of Zen Delay, ZDV introduces new features including an LFO page, groove timing options, complete automation capabilities and a preset manager - which includes presets from Mijk van Dijk, Nerk from Toktok, Dr Walker of Air Liquide, among others.

Features

- Brand new LFO page makes rhythmic animation come to life, controlling Filter and Delay, with FM and AM controls to add further dank modulation scope.
- Preset manager enables you to save your own effect settings. Also comes with a selection of killer presets from Erica Synths' talented team of mutant sound smiths such as Mijk van Dijk, Nerk from Toktok, Dr Walker of Air Liquide among others.

Phoca PDF

- New groove timings of the various triplets and dotted delay times
- Possibility to change the routing between the delay and filter stages, including the possibility to insert the filter within the feedback loop.

The ZDV is a perfect tool for use on any instrument: drums, bass, keys, guitar, vocal, FX, or foley; no matter what the instrument or sound source, ZDV will help you refine, redefine and remold your sound in fascinating ways.

Finally, for every ZDV license sold, one five-year old oak tree is planted in the reforestation project by the Liquid Sky artist collective in southern Portugal and will be cared for until the tree can survive by itself.

ZDV is available now and priced at €99.
